

Leveraging Large Language Models for Business Analytics

Chunsheng (Jerry) Jin

Outline of this class

- Review of previous class
- Understanding Large Language Models (LLMs)
- Introduction to GPT API
- Hands-on GPT API practice

Review of previous class

Naïve Bayes

- Spam email detection
 - Good performance
 - 95% accuracy
- Sentiment analysis on Twitter data
 - Poor performance
 - 76% accuracy

Review of previous class

Limitations of Naïve Bayes

- Strong assumption of independence between words
 - Ignore grammar and order
 - Do not distinguish same words with different meanings (free beer vs. free speech)

Review of previous class

Limitations of Naïve Bayes

- Strong assumption of independence between words
 - Ignore grammar and order
 - Do not distinguish same words with different meanings (free beer vs. free speech)
- **How to solve this issue?**
 - **Large Language Models (LLMs)**

Class activity 1

<https://app.sli.do/event/2wy9SoazGcMhzSCuTyzxpe>

Understanding LLMs

Machine Learning (ML)

- Naïve Bayes
- Linear regression
- Logistic regression
- Clustering analysis

Deep Learning (DL)

- Artificial neural networks (ANNs)

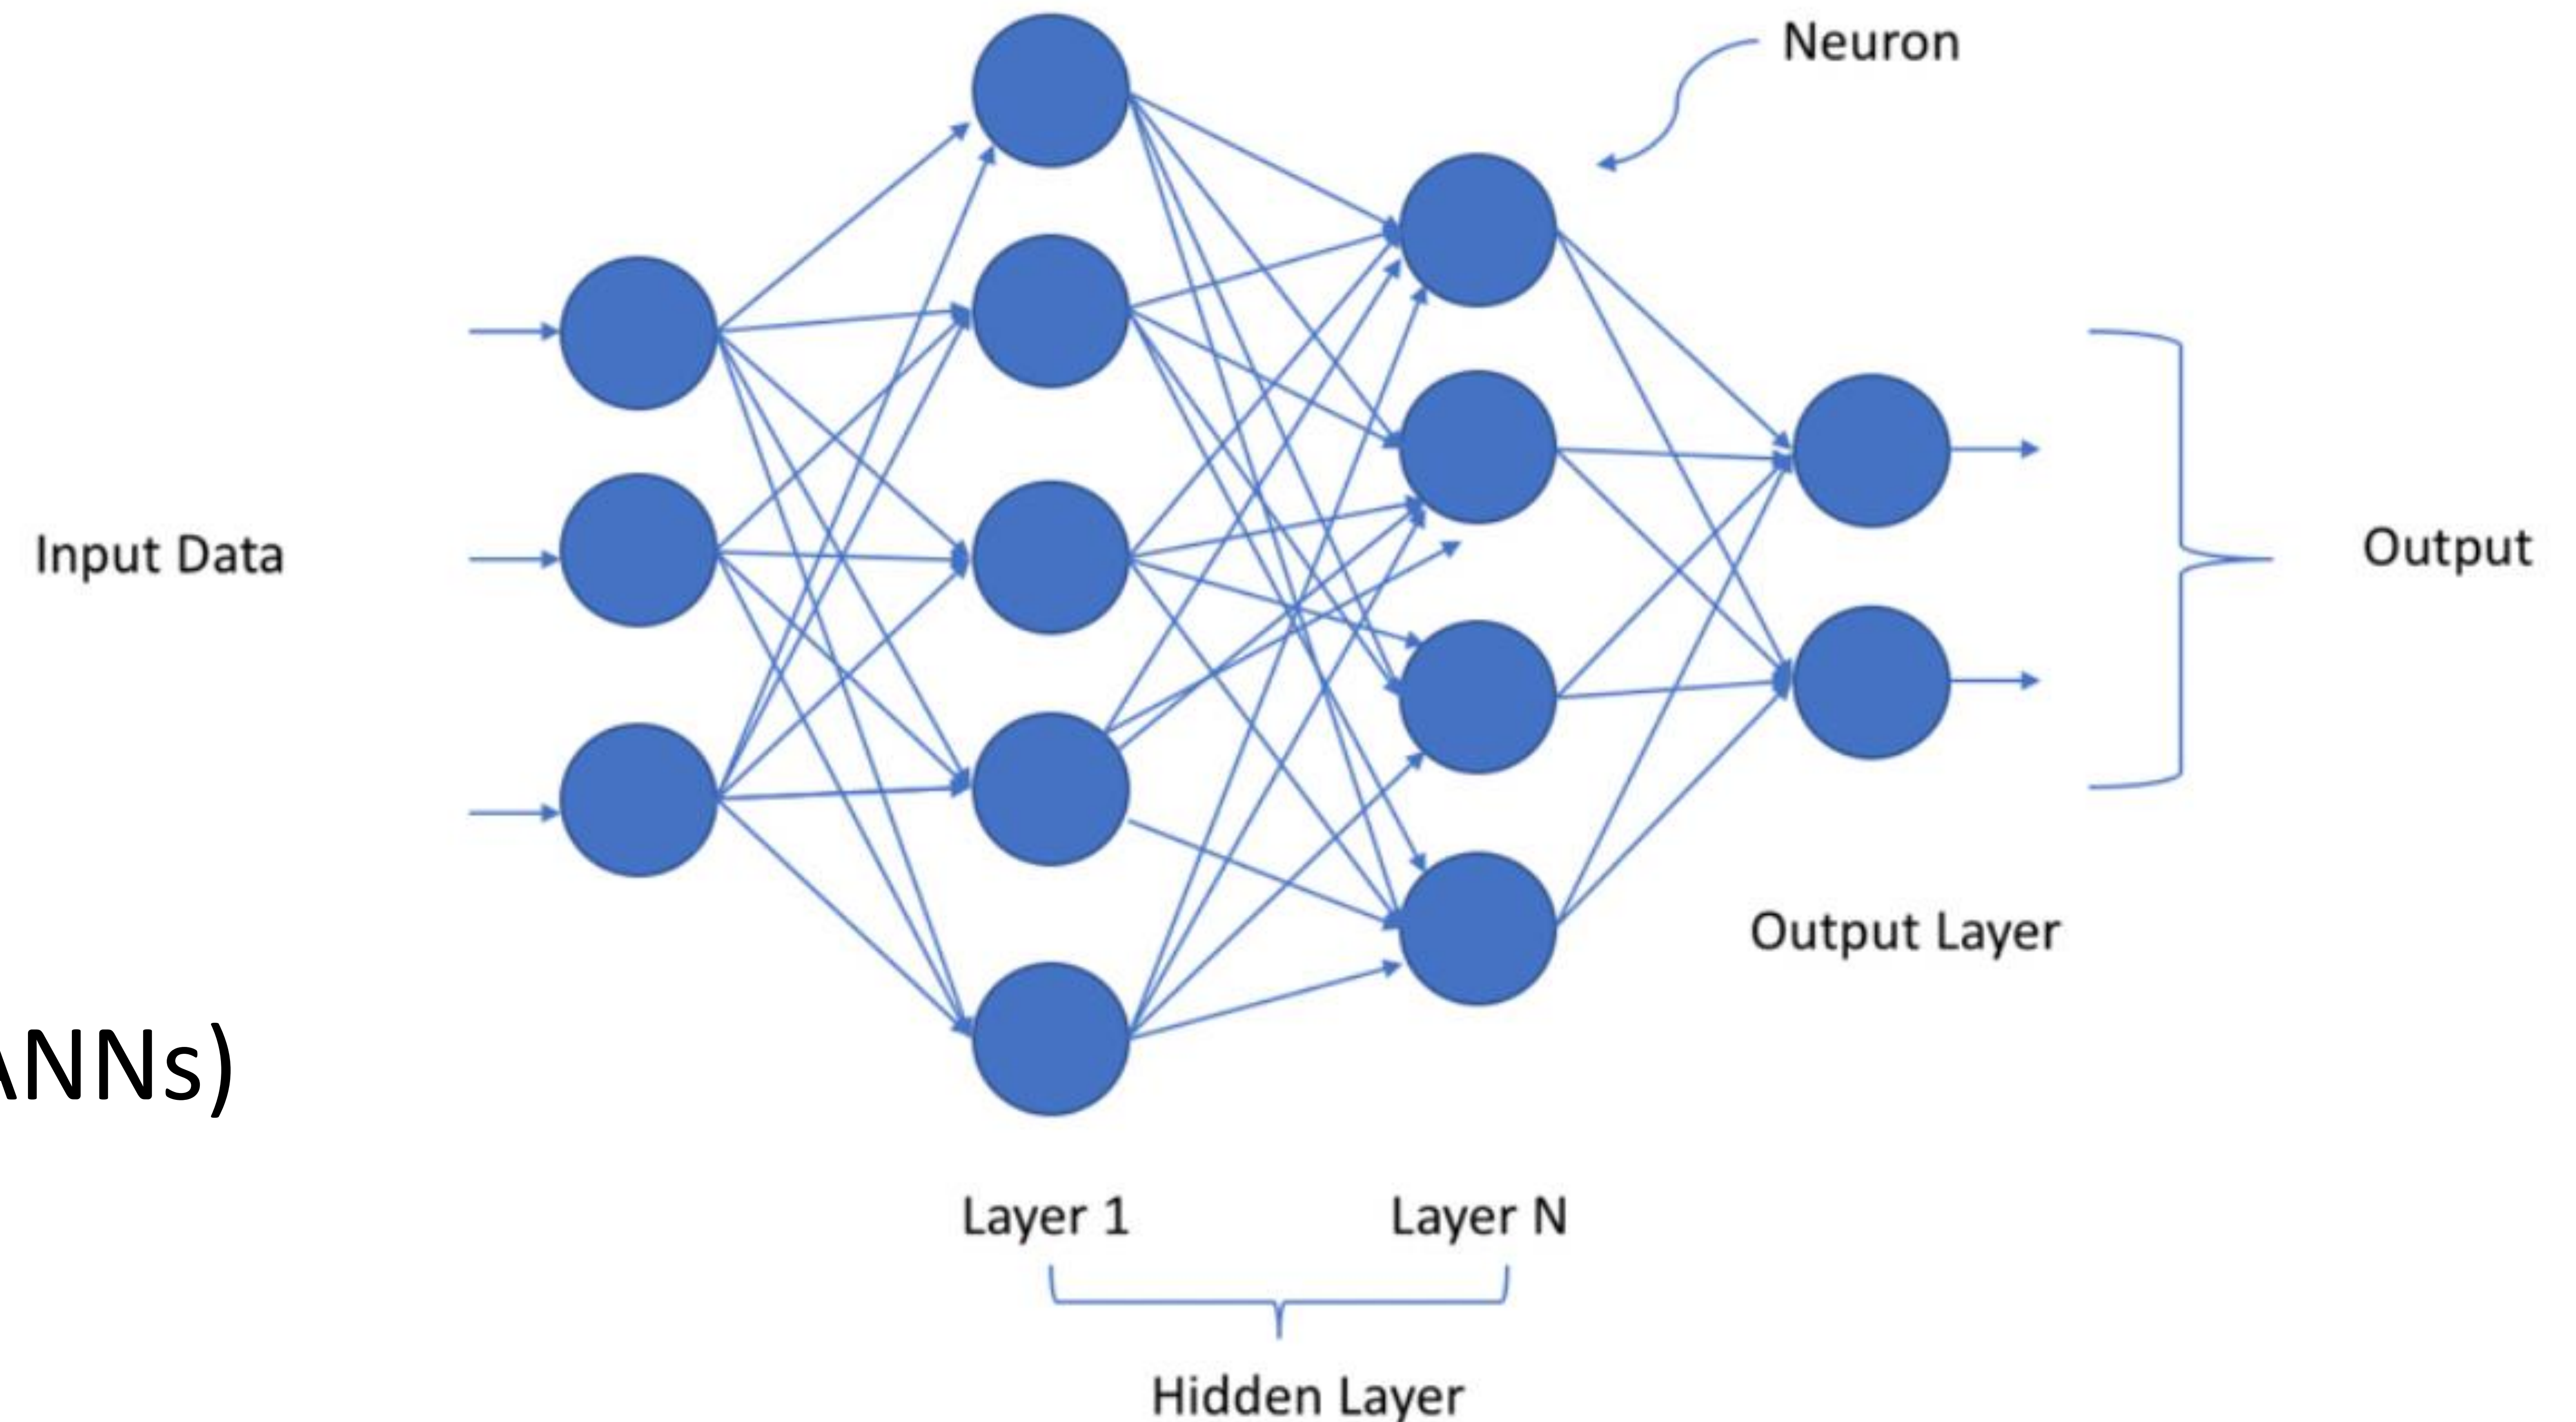

Image source: <https://towardsdatascience.com/a-laymans-guide-to-deep-neural-networks-ddcea24847fb>

Understanding LLMs

Machine Learning (ML)

- Naïve Bayes
- Linear regression
- Logistic regression
- Clustering analysis

Deep Learning (DL)

- Artificial neural networks (ANNs)
 - Deep neural networks (DNNs)
 - Convolutional neural networks (CNNs)
 - Recurrent neural networks (RNNs)
 - Transformer
 - LLMs (e.g., GPT, Claude)

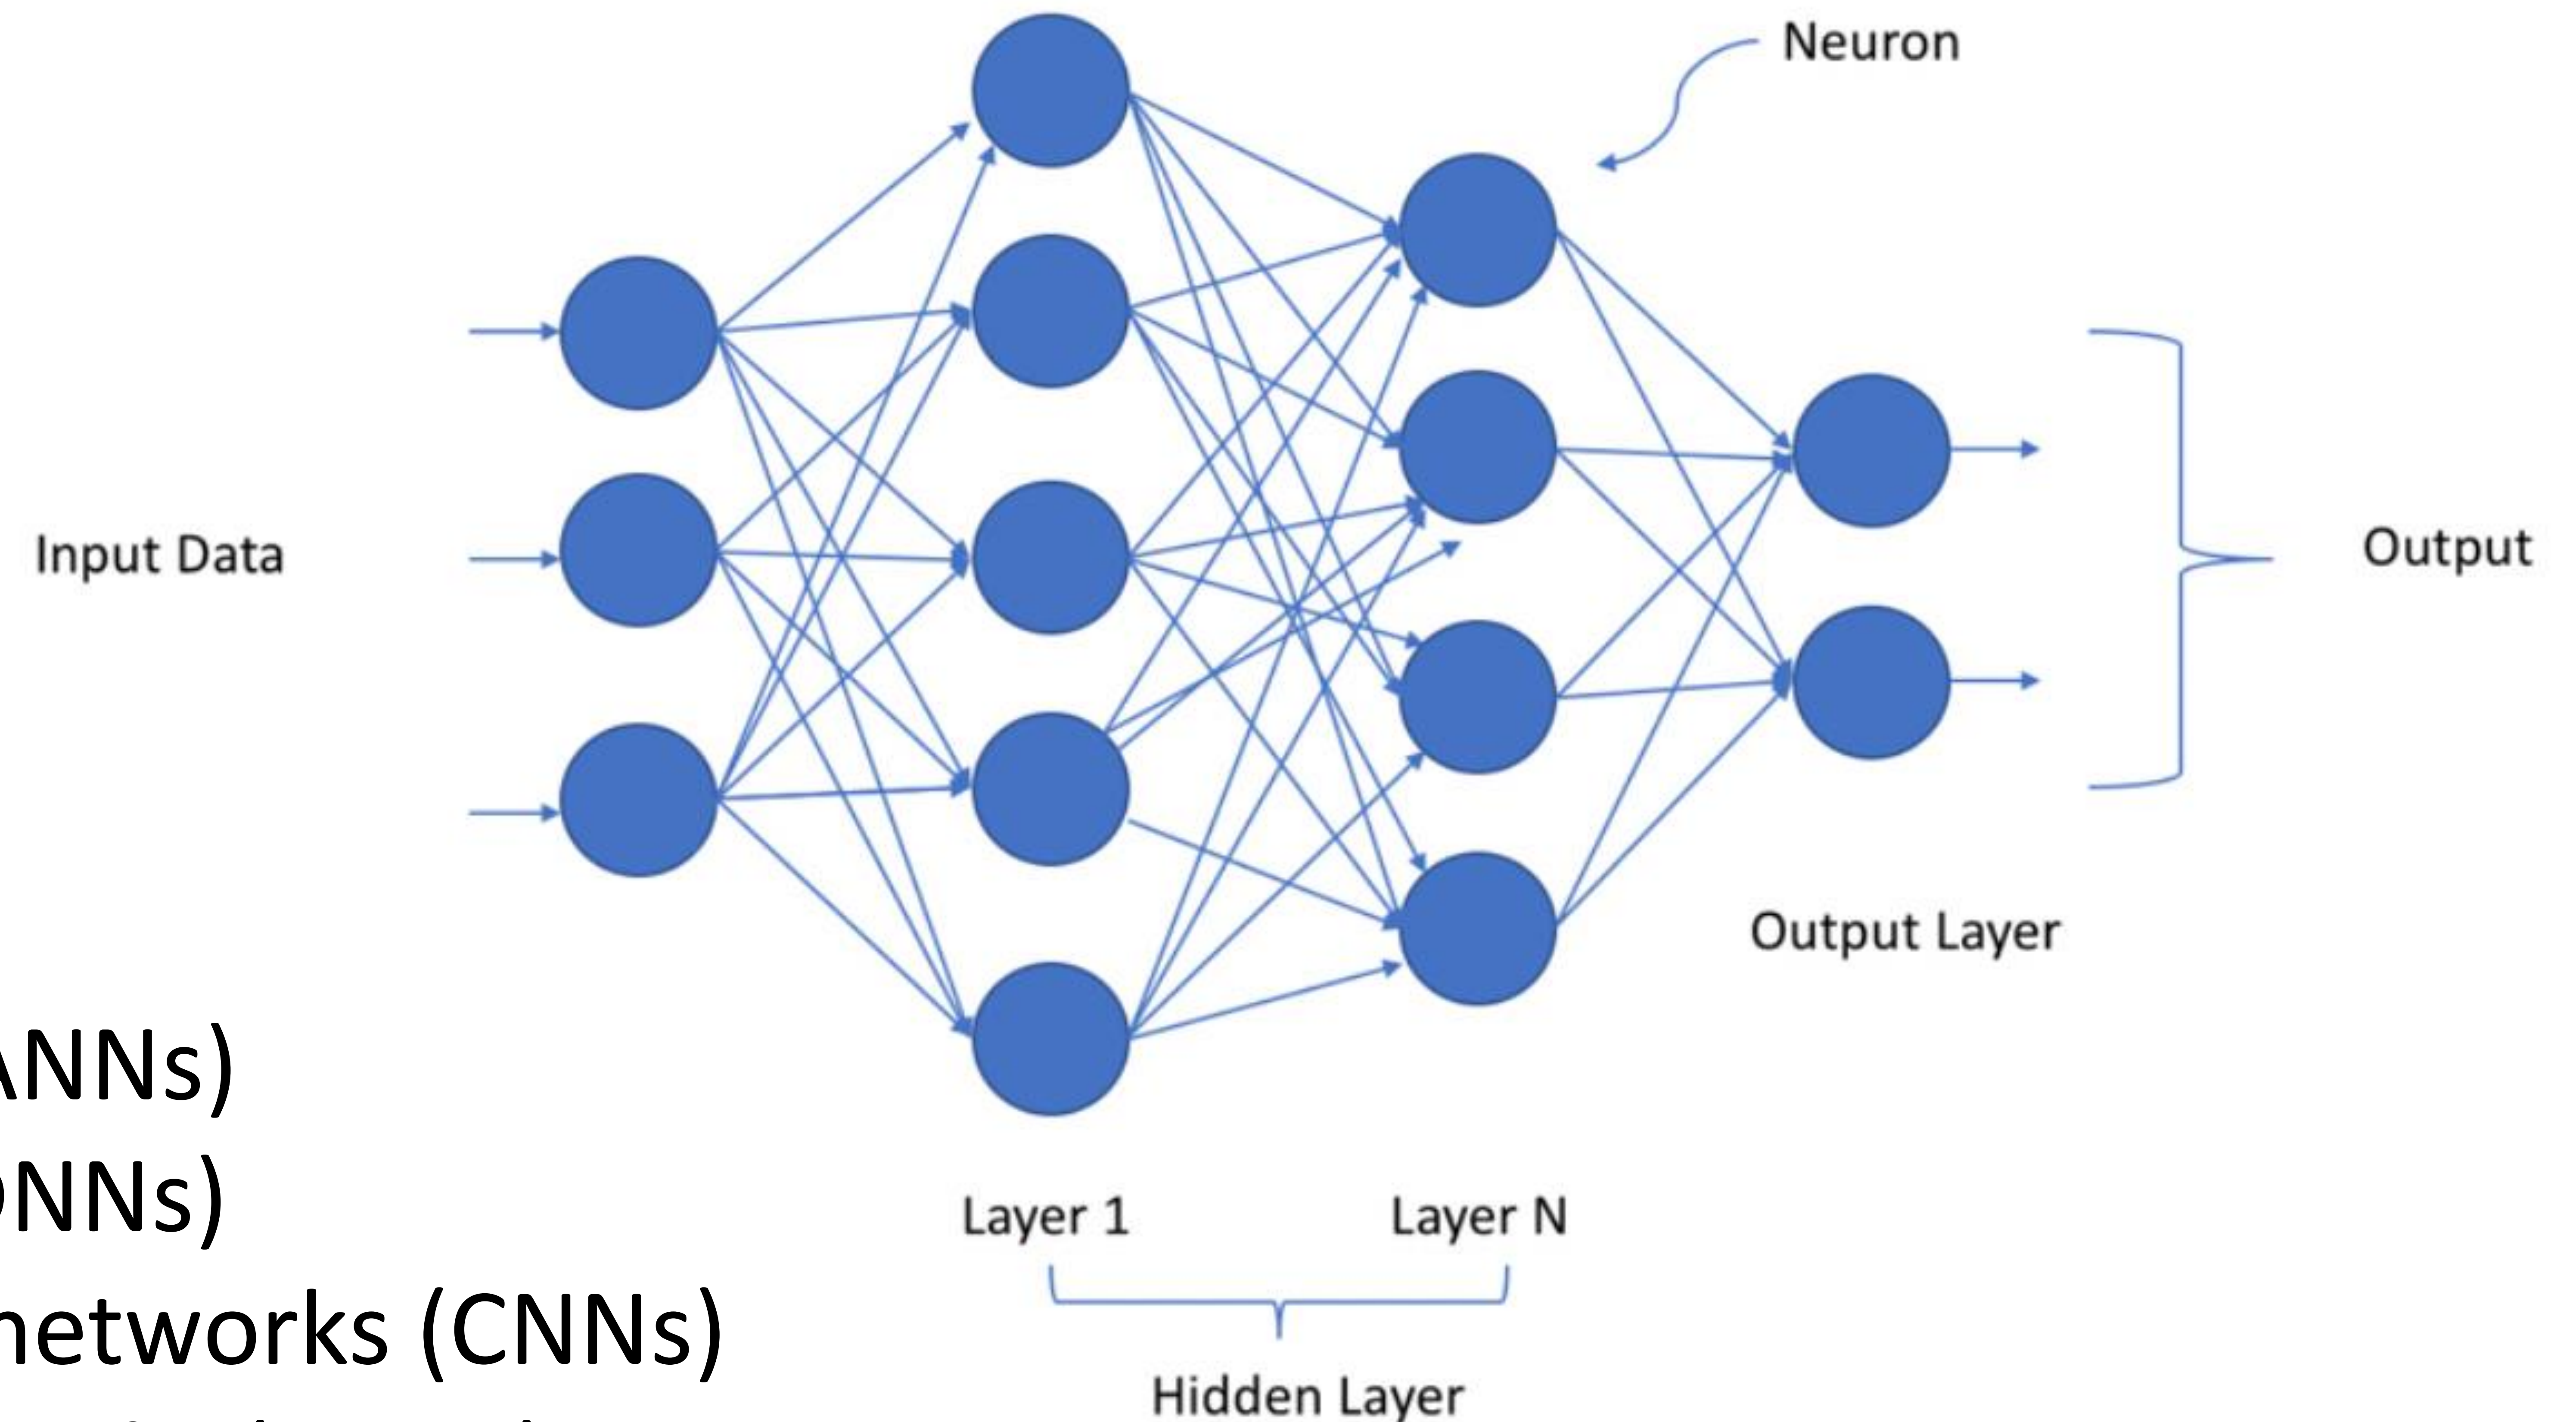

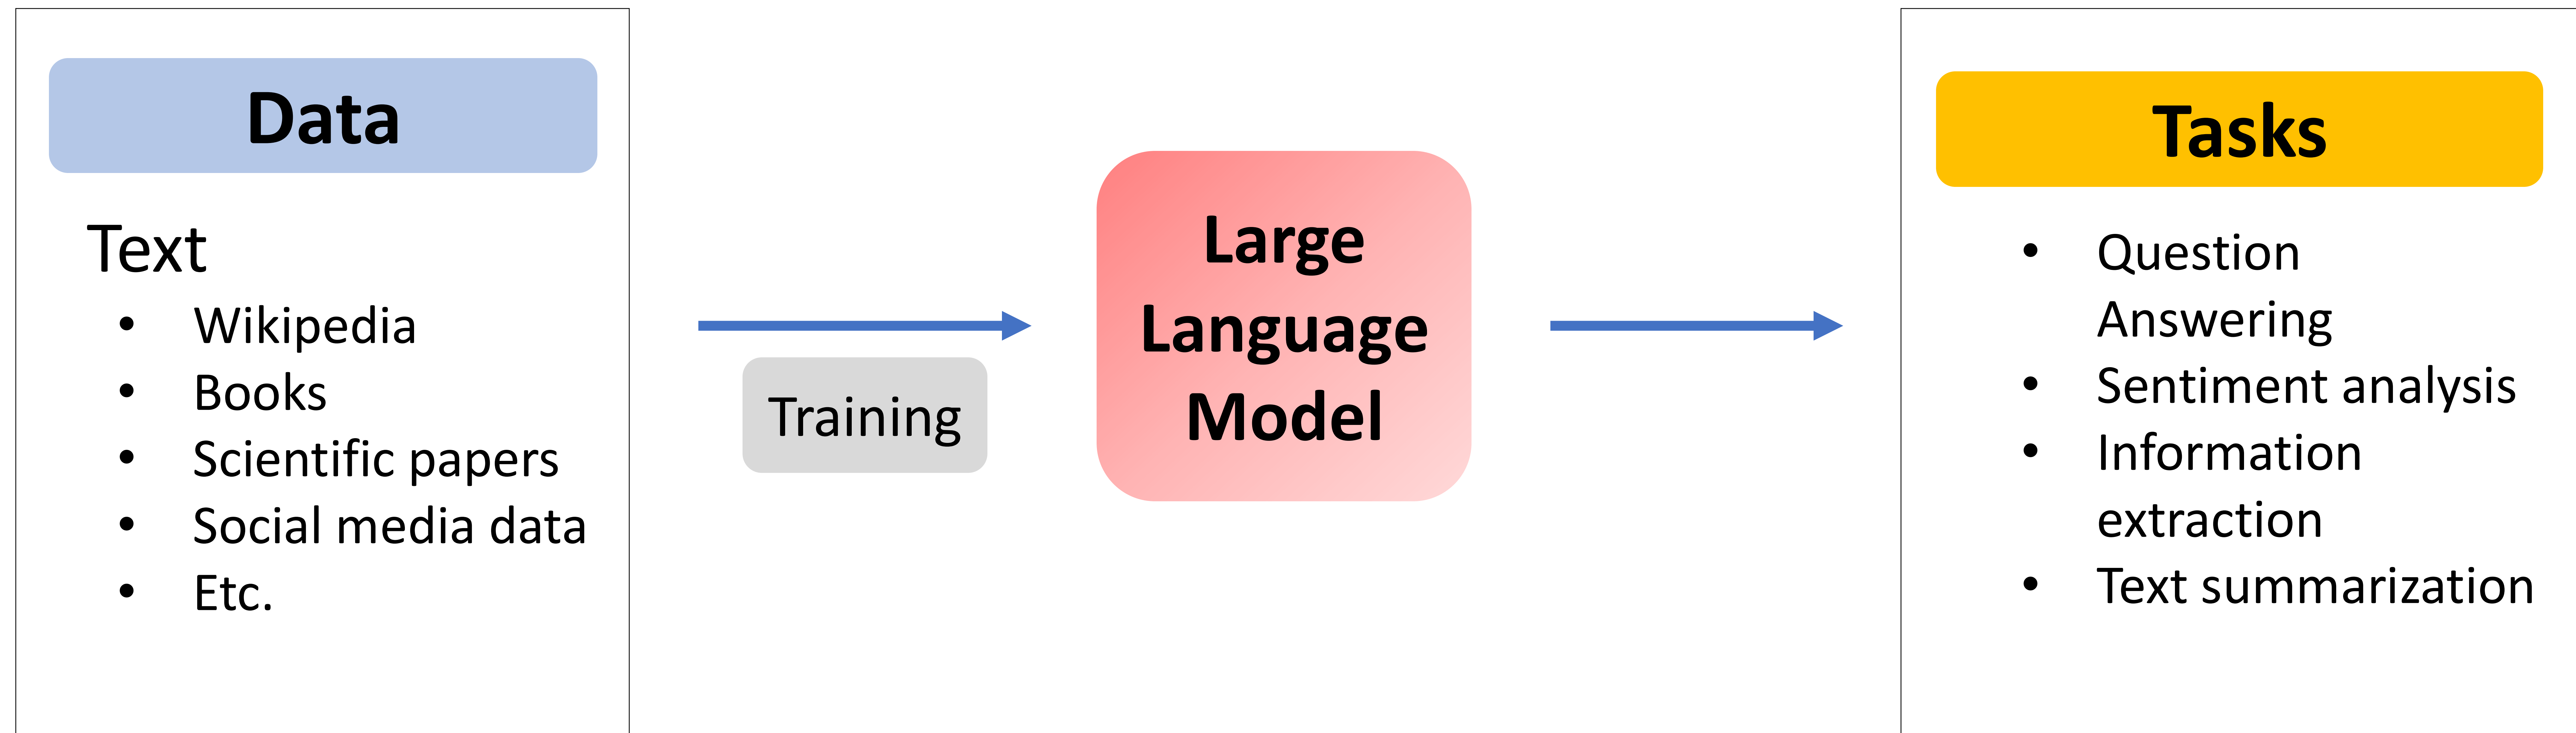

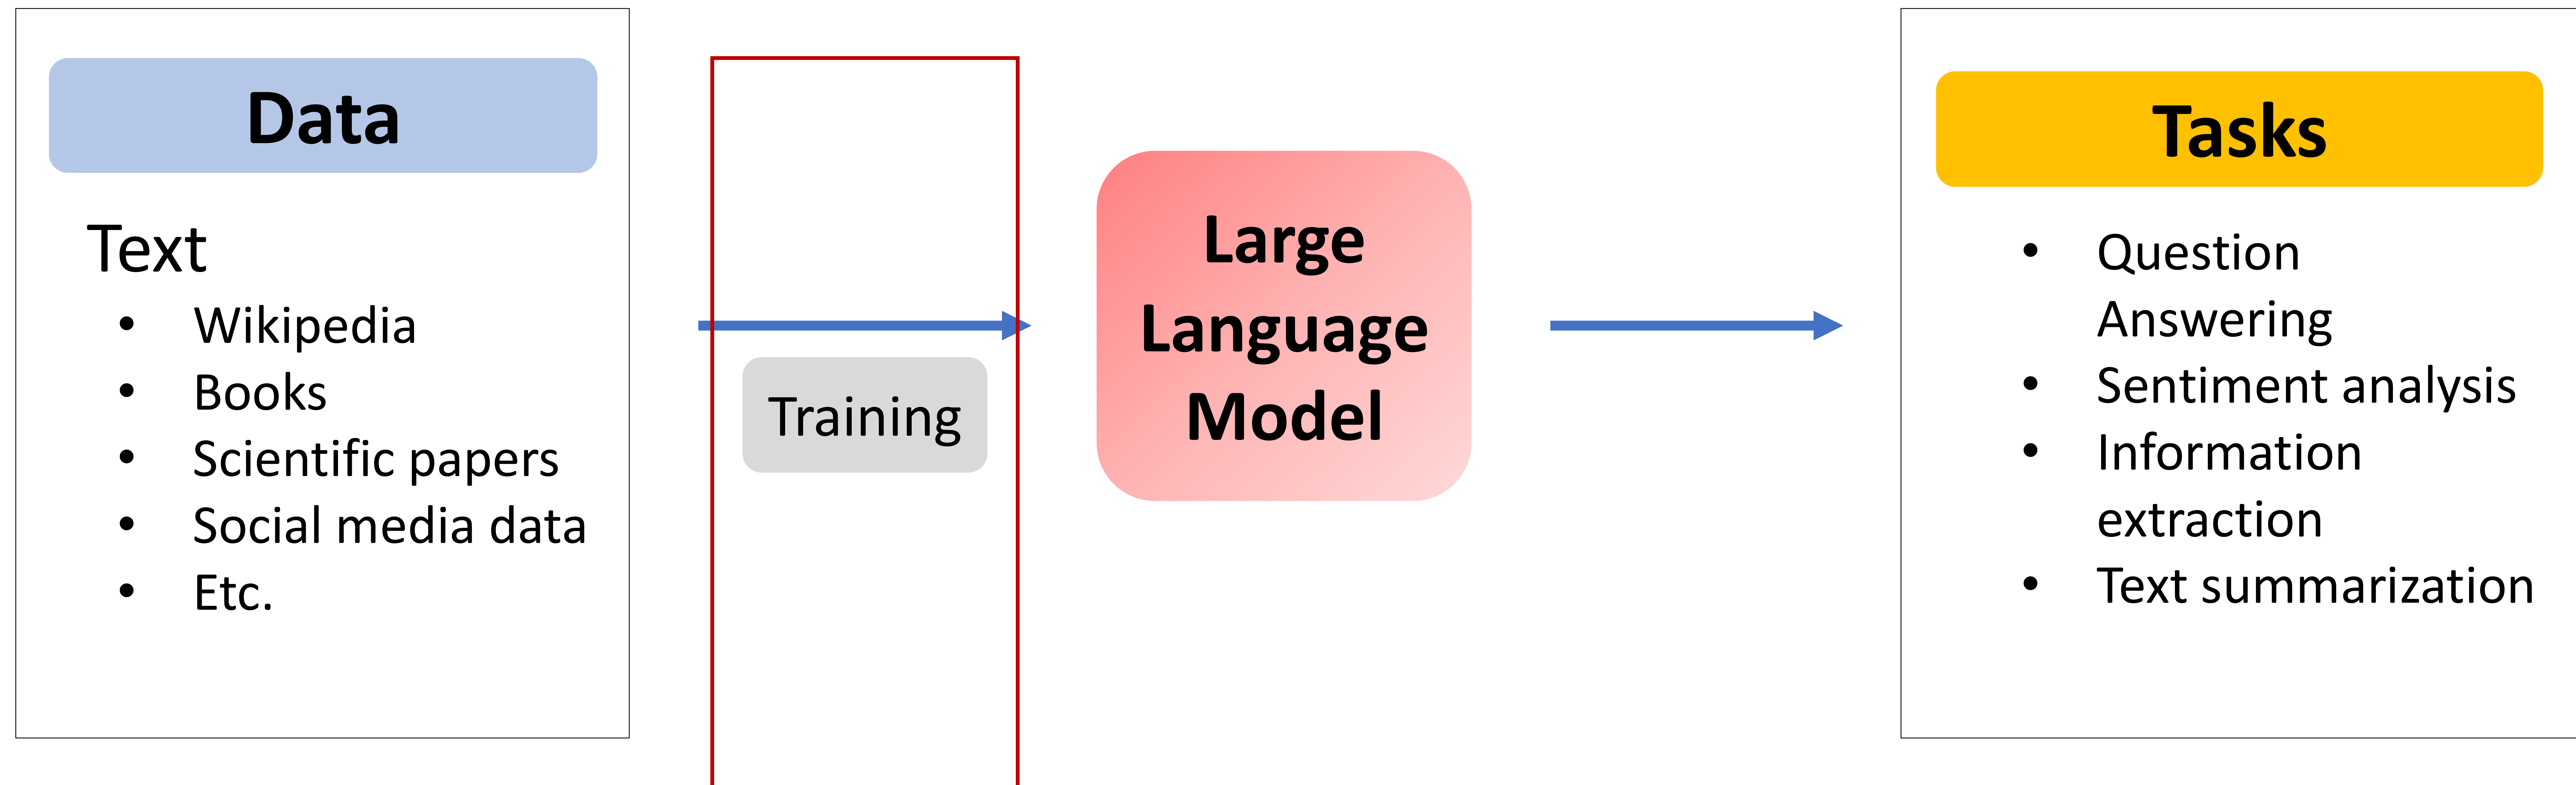

Image source: <https://towardsdatascience.com/a-laymans-guide-to-deep-neural-networks-ddcea24847fb>

How do LLMs work?

How do LLMs work?

How do LLMs work?

Training : Self-Supervised Learning

- Causal language modeling
 - Automatically predict the next word based on the previous words
 - “I am happy because I am studying at CSU Chico.”
 - Input: “I” → Output: “am”
 - Input: “I am” → Output: “happy”
 - Input: “I am happy” → Output: “because”
 - Input: “I am happy because” → Output: “I”
 - Input: “I am happy because I” → Output: “am”
 - Input: “I am happy because I am” → Output: “studying”
 - Input: “I am happy because I am studying” → Output: “at”
 - Input: “I am happy because I am studying at” → Output: “CSU”
 - Input: “I am happy because I am studying at CSU” → Output: “Chico”

Large Language Models (LLMs)

- Leading LLMs
 - OpenAI: GPT
 - Anthropic: Claude
 - Google : Gemini
- Perform NLP tasks
 - Question answering
 - Machine translation
 - Text summarization
 - Programming code generation

Current Capabilities of LLMs

- OpenAI introduced Operator on January 23, 2025

GPT API

GPT (Generative Pre-trained Transformer)

- **Generate** natural language
- **Pre-trained** on big data
- **Transformer** architecture
- GPT models: GPT4o and GPT4o mini
- ChatGPT is the Chatbot developed based on the GPT models.

GPT API

API (Application Programming Interface)

- Allow different software applications to communicate with each other

Source: <https://www.geeksforgeeks.org/what-is-an-api/>

GPT API

- Provide access to GPT models to perform various NLP tasks

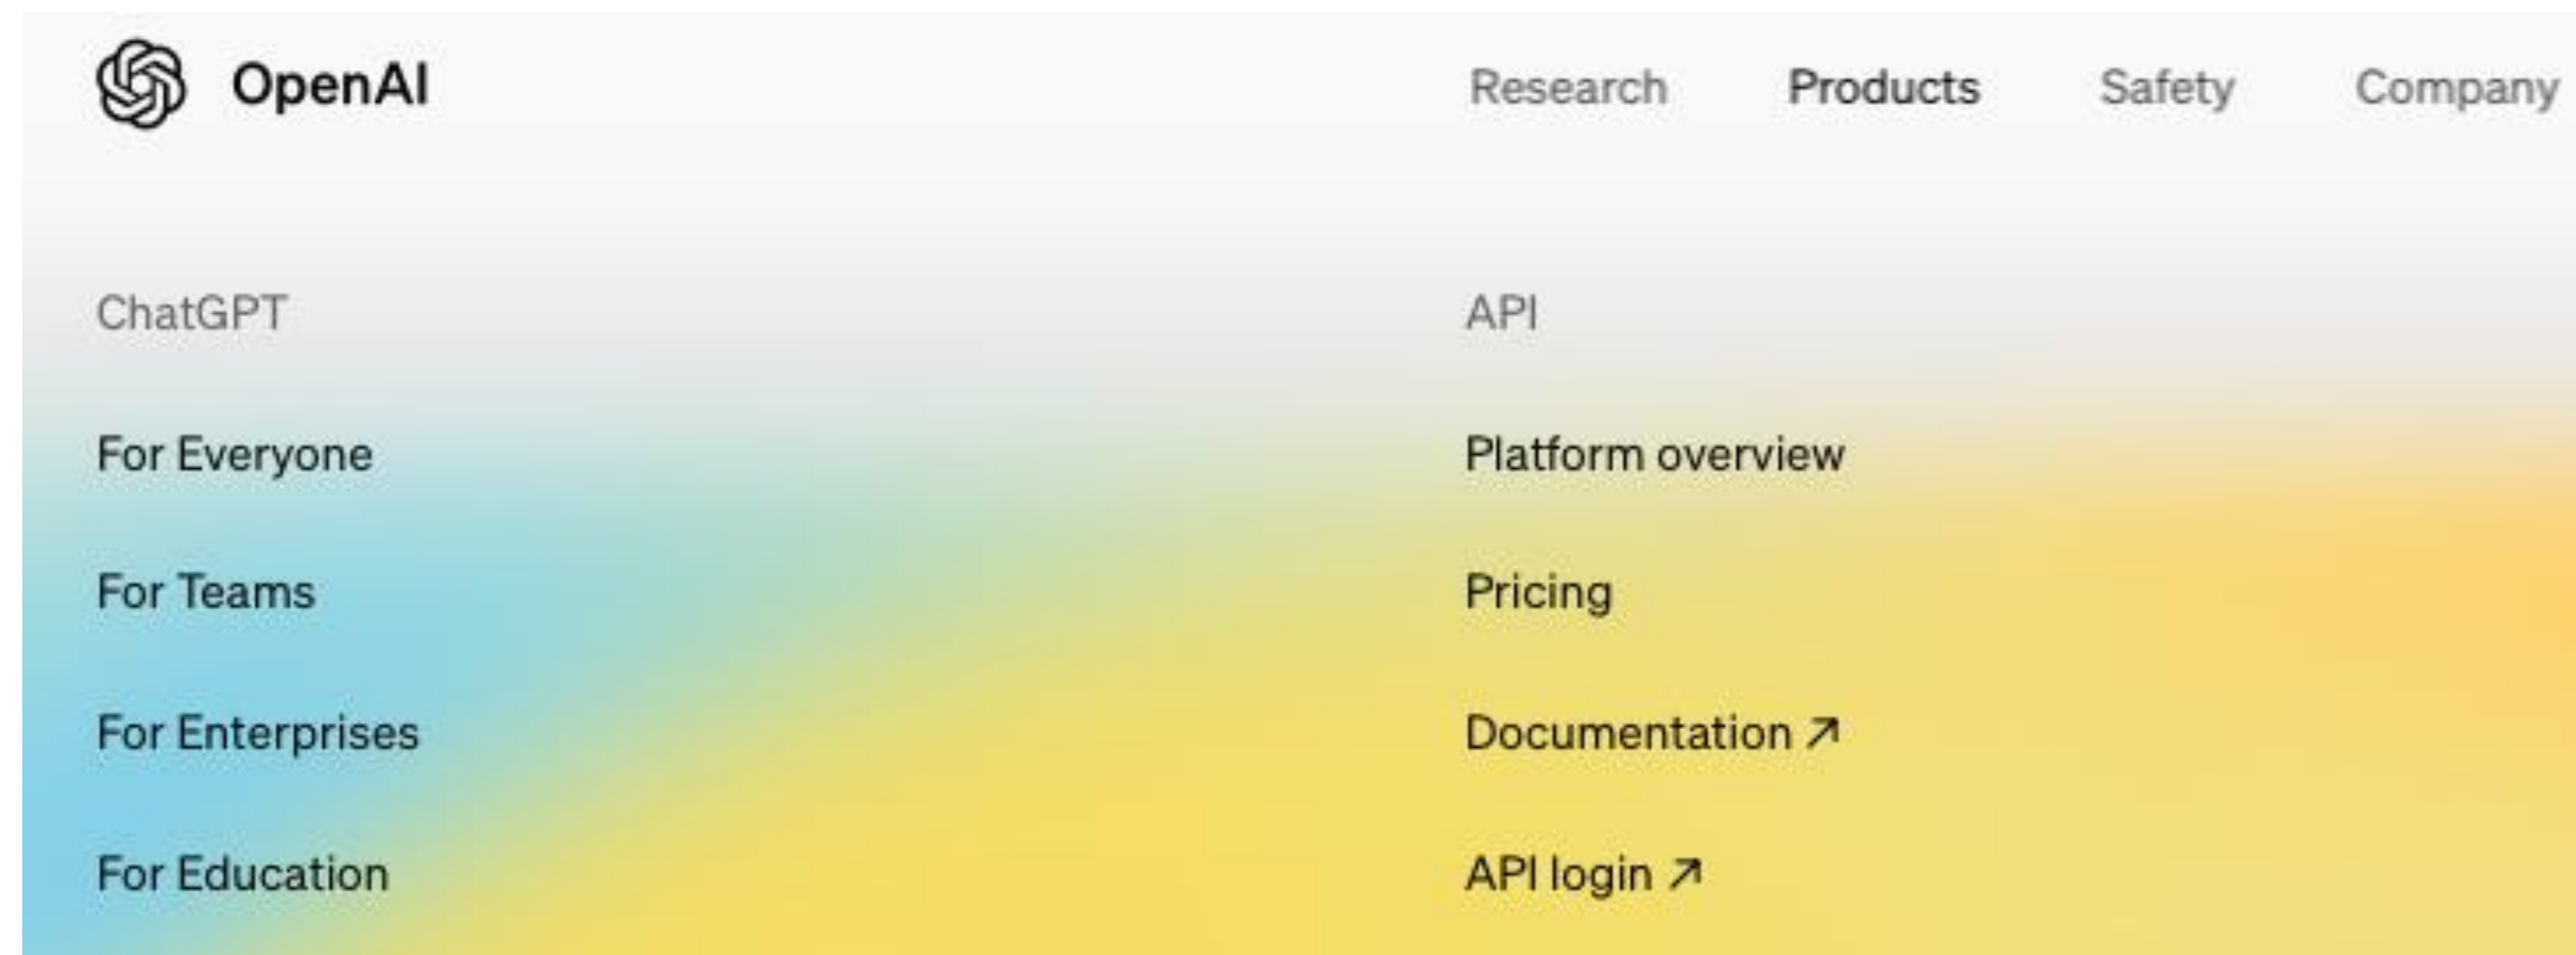

Advantages of GPT API over ChatGPT

- Scalability: Request large volumes of requests
 - OpenAI o1: 50 messages a week (as of December 2024)
- Consistent Performance:
 - e.g., set parameter of temperature=0

Get GPT API Access

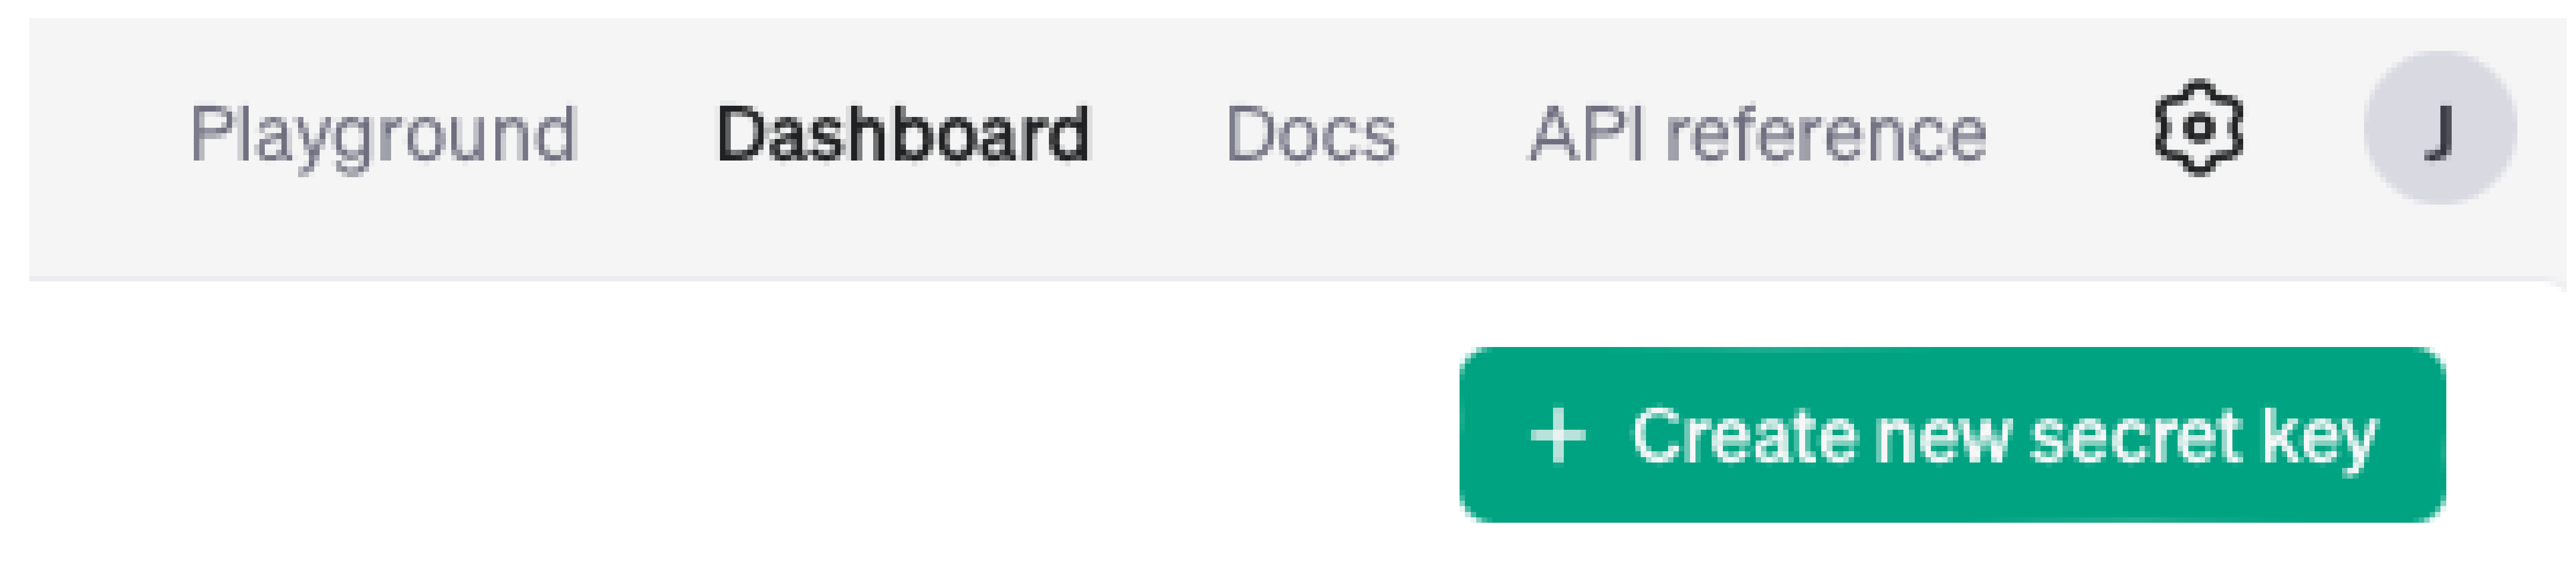

- Go to the [OpenAI website](#) and sign up for an account.

- Go to Dashboard on the top right corner.

Get GPT API Access

- Click “API keys” on the left column => Click “Create new secret key”

Get GPT API Access

- Create an API key in a pop-up window for secret key.

Create new secret key

Owned by

☐ You ☐ Service account

This API key is tied to your user and can make requests against the selected project. If you are removed from the organization or project, this key will be disabled.

Name Optional

Project

Permissions

☐ All ☐ Restricted ☐ Read only

Save your key

Please save your secret key in a safe place since **you won't be able to view it again**. Keep it secure, as anyone with your API key can make requests on your behalf. If you do lose it, you'll need to generate a new one.

[Learn more about API key best practices](#)

Group discussion

Two students are paired to discuss the question below and share your discussion with the class:

- Can we trust the results generated by LLMs? Why or why not?

Takeaways

- Learned what LLMs are and how they work
- Introduced GPT API
- Used GPT API to perform two tasks

Model Evaluation

- Confusion Matrix
 - A table used to describe the performance of a classification model

	Predicted Positive	Predicted Negative
Actual Positive	True Positive (TP)	False Negative (FN)
Actual Negative	False Positive (FP)	True Negative (TN)

Model Evaluation

- Confusion Matrix

	Predicted Positive	Predicted Negative
Actual Positive	True Positive (TP)	False Negative (FN)
Actual Negative	False Positive (FP)	True Negative (TN)

$$\text{Accuracy} = \frac{TP + TN}{TP + FN + FP + TN}$$

$$\text{Precision} = \frac{TP}{TP + FP}$$

$$\text{Recall or Sensitivity} = \frac{TP}{TP + FN}$$

$$\mathbf{F1} = 2 \frac{\text{Precision} * \text{Recall}}{\text{Precision} + \text{Recall}}$$

Model Evaluation

- Confusion Matrix

	Yes	No
Yes	5	1
No	0	4

$$\text{Accuracy} = \frac{\text{correctly predicted instances}}{\text{total number of instances}} = \frac{9}{10} = 90\%$$

$$\text{Accuracy} = \frac{TP + TN}{TP + FN + FP + TN}$$

$$\text{Precision} = \frac{TP}{TP + FP}$$

$$\text{Recall or Sensitivity} = \frac{TP}{TP + FN}$$

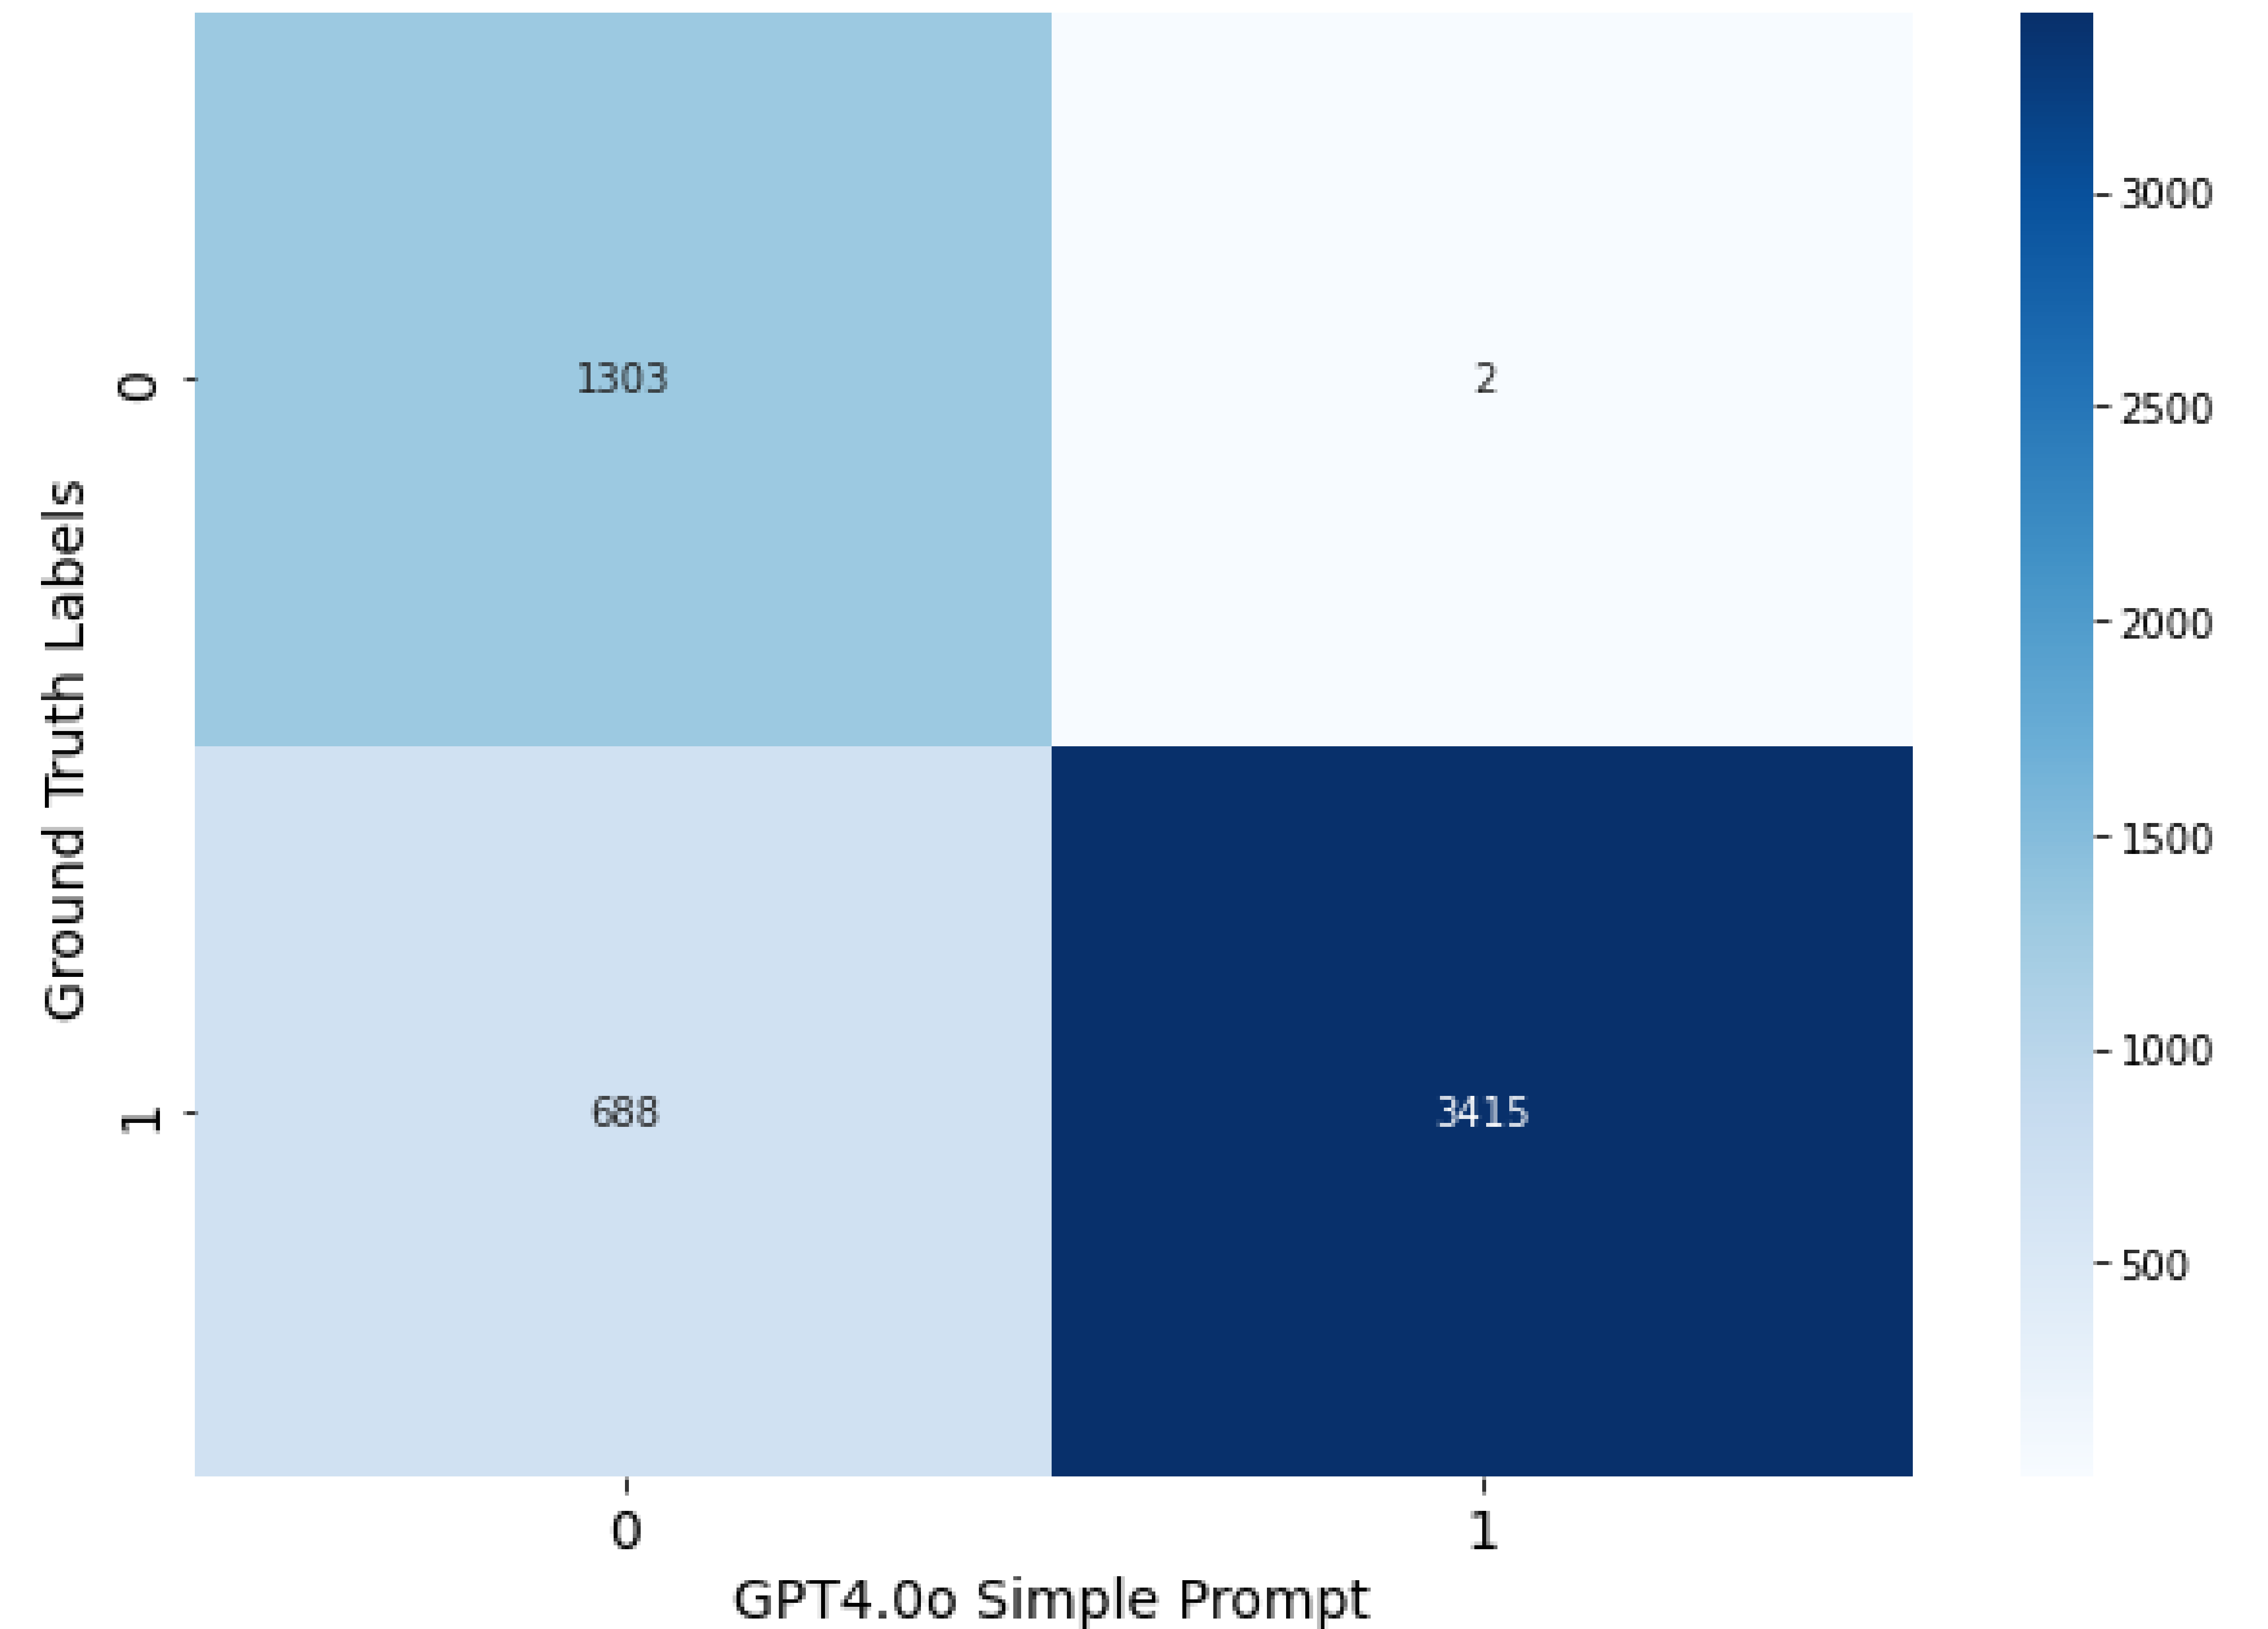

$$\mathbf{F1} = 2 \frac{\text{Precision} * \text{Recall}}{\text{Precision} + \text{Recall}}$$

Model Evaluation

- Ground truth
 - True classification values used to compare with GPT-generated results for model evaluation
- In the example, our true sentiment values are the star ratings by reviewers.
 - 1 & 2 stars => negative
 - 4 & 5 stars => positive

Model Evaluation

- Draw a Confusion Matrix

Model Evaluation

Sentiment analysis using standard prompt

```
prompt = f"""
```

What is the sentiment of the following hotel review, which is delimited with triple backticks?

Give your answer as a single word, either "positive" or "negative".

```
Review text: ```{review}```  
"""
```

Models	Precision	Recall	F1	Accuracy
GPT-4o	0.8263	0.9149	0.8487	0.8717

Takeaways

- Learned what LLMs are and how they work
- Introduced GPT API
- Used GPT API to perform two tasks
- Learned model evaluation

How can we improve model performance?

Improving GenAI Performance

Prompt engineering techniques

- Chain of Thought (CoT)
- Self-Reflection (SR)

Improving GenAI Performance

Chain of Thought (CoT)

- Involve a sequence of intermediate reasoning steps

Standard Prompting

Model Input

Q: Roger has 5 tennis balls. He buys 2 more cans of tennis balls. Each can has 3 tennis balls. How many tennis balls does he have now?

A: The answer is 11.

Q: The cafeteria had 23 apples. If they used 20 to make lunch and bought 6 more, how many apples do they have?

Model Output

A: The answer is 27. ❌

Chain-of-Thought Prompting

Model Input

Q: Roger has 5 tennis balls. He buys 2 more cans of tennis balls. Each can has 3 tennis balls. How many tennis balls does he have now?

A: Roger started with 5 balls. 2 cans of 3 tennis balls each is 6 tennis balls. $5 + 6 = 11$. The answer is 11.

Q: The cafeteria had 23 apples. If they used 20 to make lunch and bought 6 more, how many apples do they have?

Model Output

A: The cafeteria had 23 apples originally. They used 20 to make lunch. So they had $23 - 20 = 3$. They bought 6 more apples, so they have $3 + 6 = 9$. The answer is 9. ✅

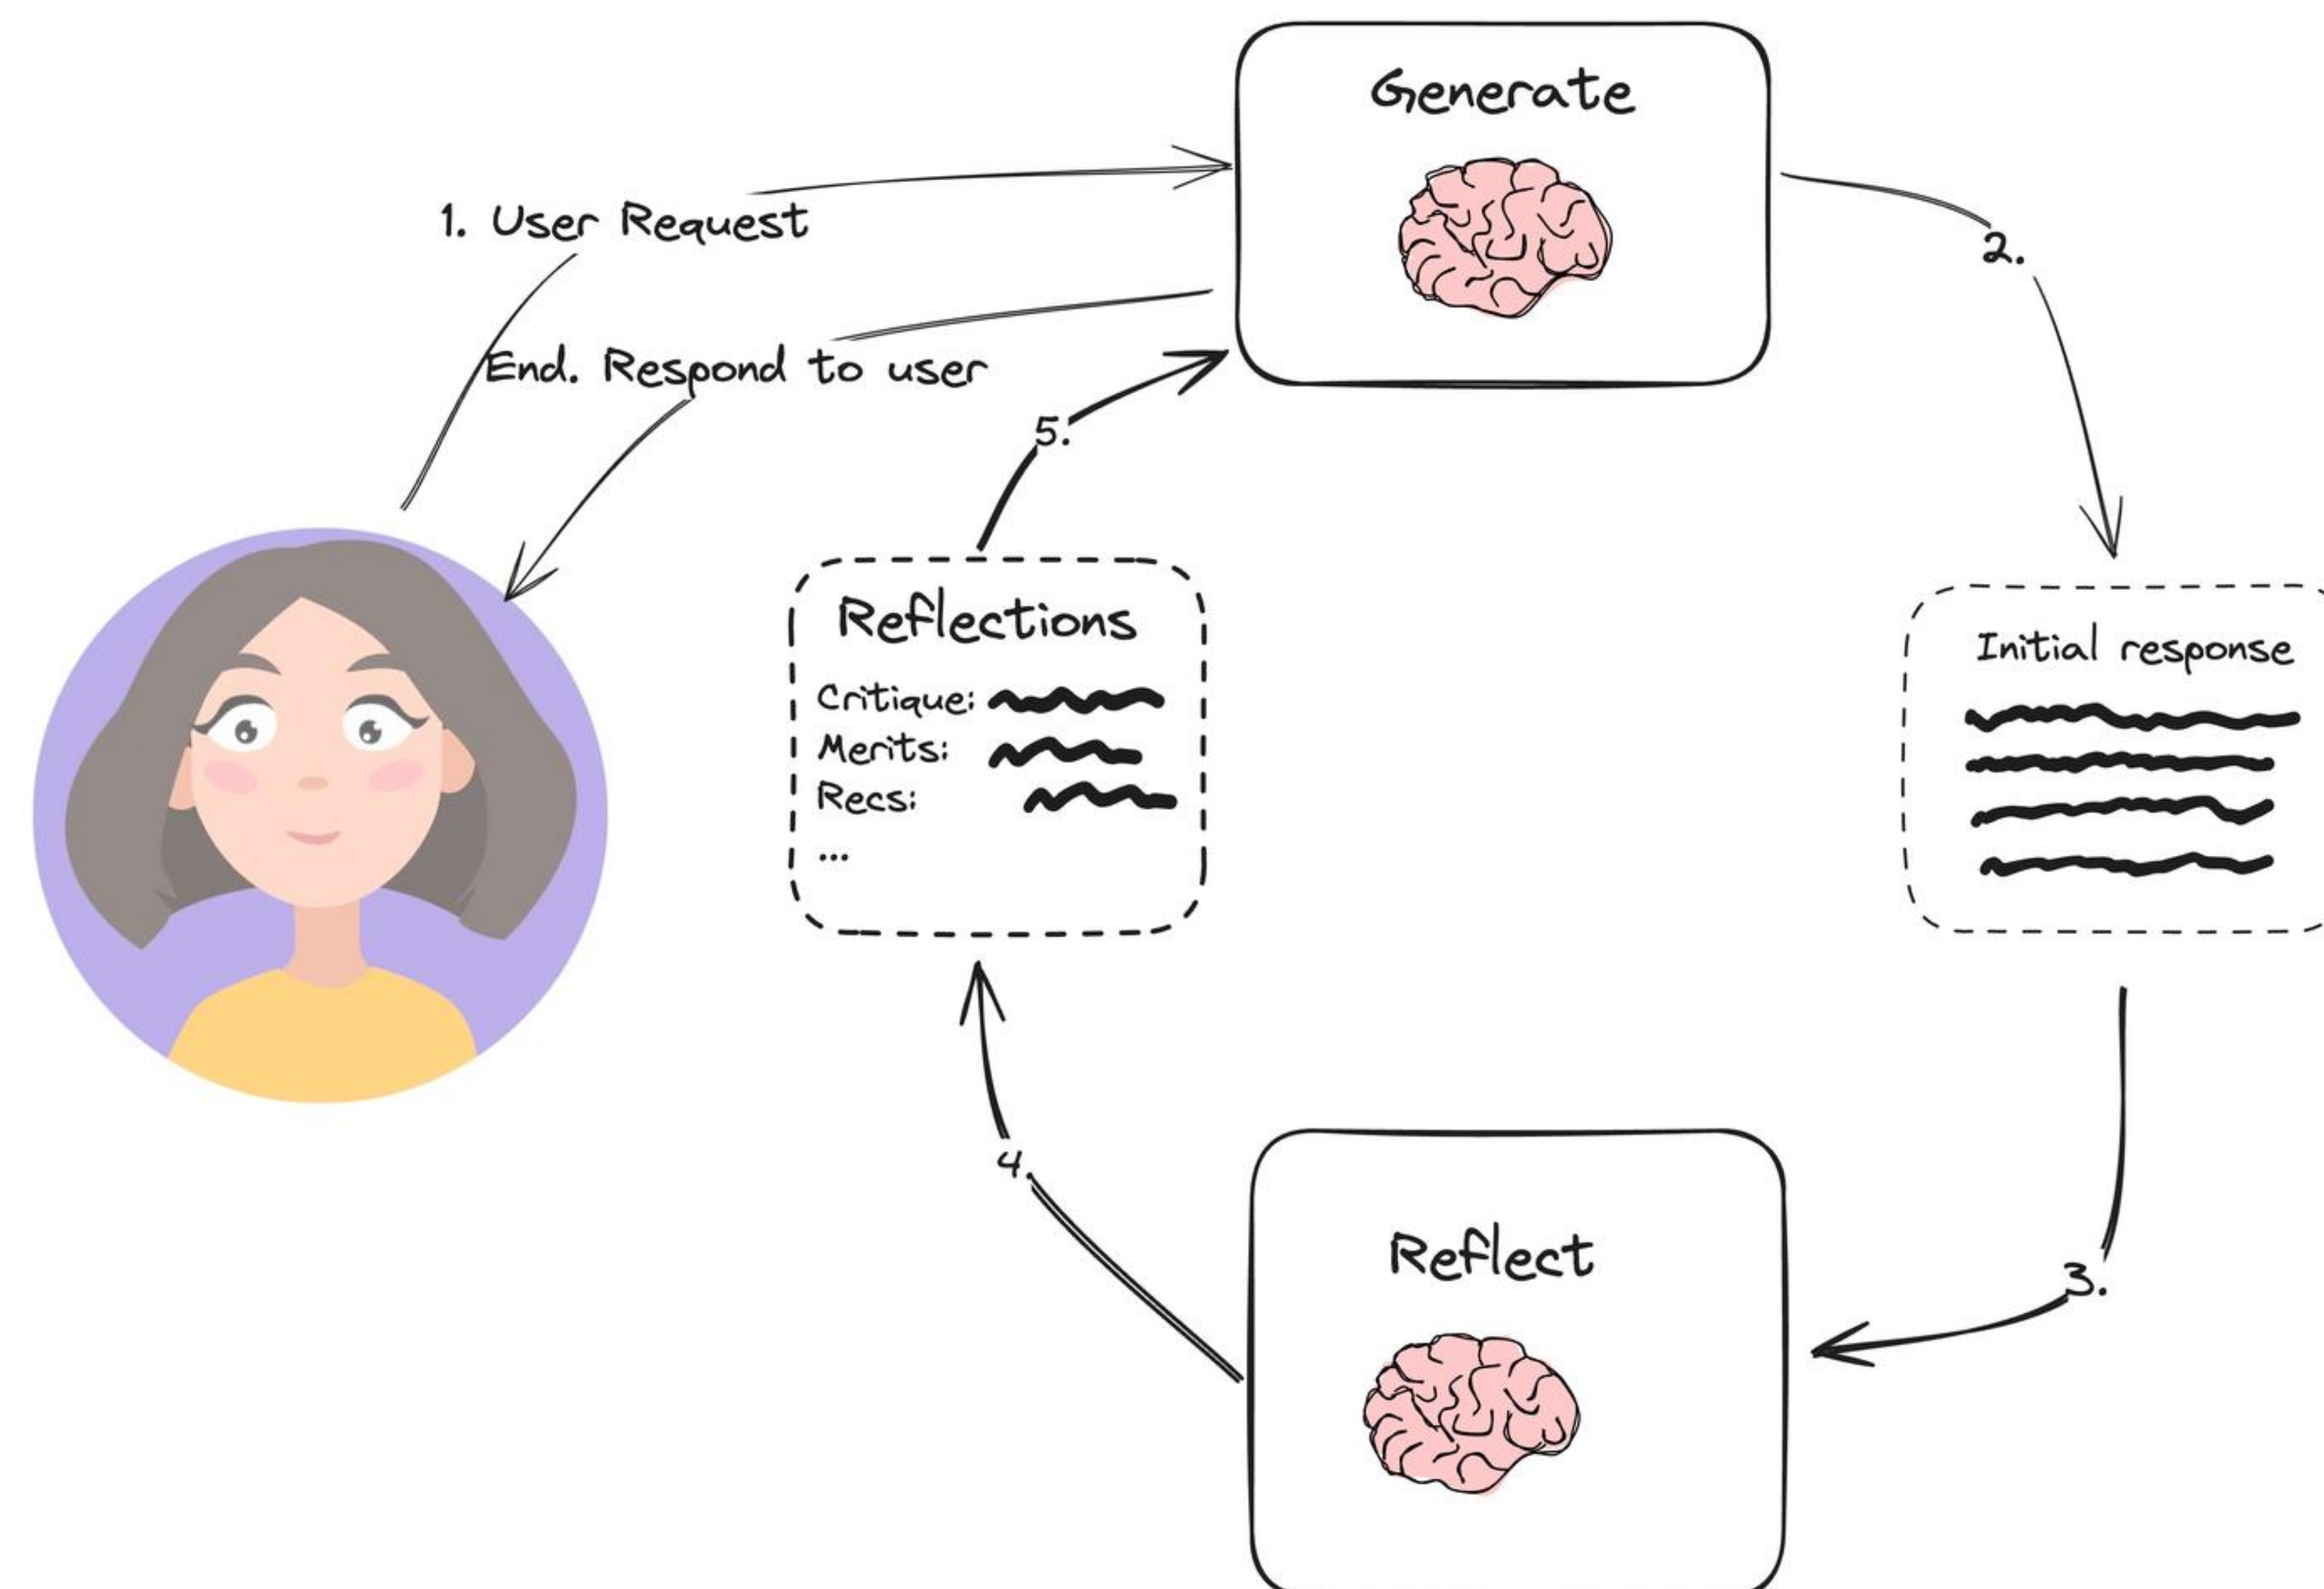

Adding reasoning step

“Let’s think step by step”

Improving GenAI Performance

- **Self-Reflection (SR)**

- Involves an LLM reflecting or evaluating its output to understand its reasoning process
- E.g., ask the model “are you sure?” about the generated output

Improving GenAI Performance

Sentiment analysis using CoT+SR prompt

Models	Prompts	Precision	Recall	F1	Accuracy
GPT-4o	CoT+SR	0.9317	0.9714	0.9491	0.9610

- Let's look at how the model performance can be improved through Python Jupyter Notebook

Thank You
